1 Question No. 2.28

Construct a quadrilateral ABCD such that AB =5, $\angle A = 50^\circ$, AC = 4, BD = 5 and AD = 6.

2 Explanation

The rough figure of the expected quadrilateral ABCD is given in Figure 2.1.

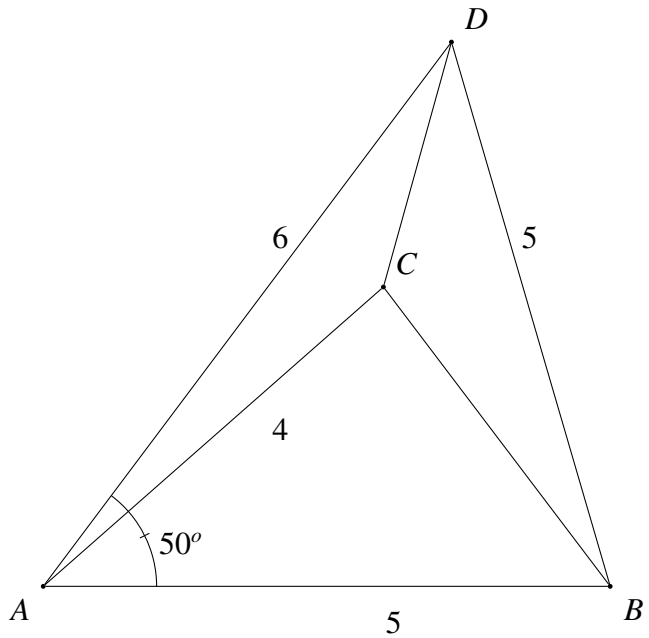

Fig. 2.1: Rough Figure

For this quadrilateral adjacent side lengths AB,AD and diagonal BD is known. Three sides of $\triangle ABD$ are therefore known.

So, $\angle A$ can also be found out using the Cosine Rule. But value for $\angle A$ is given. So we need to verify it.

$$\cos A = \frac{(\|\mathbf{B}-\mathbf{A}\|)^2 + (\|\mathbf{D}-\mathbf{A}\|)^2 - (\|\mathbf{D}-\mathbf{B}\|)^2}{2 \times (\|\mathbf{B}-\mathbf{A}\|) \times (\|\mathbf{D}-\mathbf{A}\|)} \tag{2.0.1}$$

$$\cos A = \frac{5^2 + 6^2 - 5^2}{2 \times 5 \times 6} \tag{2.0.2}$$

$$\implies \angle A = \cos^{-1}(0.6) \tag{2.0.3}$$

So $\angle A = 53.13^\circ$.

But $\angle A = 50^\circ$ is given which causes a mismatch.

Therefore construction of quadrilateral with given measurements is not possible.
